

I am writing for my personal belief the information brought forward from the Garnaut Review is critical to our future. We are at a critical point where we can either be the front runners in an amazing show of concern for the environment and our planet, using scientific evidence and scientific solutions.

I see some many easy to fix problems all around me day to day, the use of solar energy, making the most of what is beating down on our country daily. Educating children at a young age and setting an example so they come up with knowledge and passion to preserve what could be lost forever, the urgency. School all around my area don't, won't even recycle, that scares me that a simply was of lowering our needs and reusing isn't a compulsory part of education.

I see a change is possible, it will create jobs making and sustaining a sustainable future, it will also keep our tourism alive if we keep our beautiful nature, such as the Great Barrier Reef alive.

30 percent cuts will cost 80 cents a day for families that is a small and affordable price to pay for a healthy planet so families can prosper for generations to come.

Thank you for your time,
Guy Stoddart
