

I am writing to make a submission to the Garnaut Review in support of strong targets to reduce greenhouse pollution.

I believe that reducing greenhouse pollution is a major issue for the current generations and future generations of humans to come if we are to ensure a viable and suitable environment for ourselves and flora and fauna in future years.

I currently work within the NSW Department of Environment and Climate Change and can see that a number of management practices are occurring, however more can be done in this and other sectors of government, business and communities and I believe that a target set by the federal government will lead the way for all sectors.

My family is currently signed up to green electricity through our energy company and we are happy to pay a higher price to contribute to reducing our greenhouse emissions. We understand that if we want to have a future where our natural and agricultural assets are viable then we need to make some sacrifices.

Therefore I urge you to recommend that Australia sets strong, science-based targets to reduce greenhouse pollution by at least 30 per cent by 2020.

Thank you
Rachel Gleeson
