

Ross Garnaut's report makes clear we must change our forest management practices. Native forests need to be preserved as carbon sinks, to cleanse the atmosphere. Cutting down those trees to feed a pulpmill can only result in more pollution and more climate change.

The building of Gunns pulpmill will ensure that Tasmania's economic future is tied to old technology for the foreseeable future. It will exacerbate the many problems that already exist in this state, as well as create new ones. We need new solutions, not a 'near enough is good enough' attitude.

New research has shown that the poisonous fumes that Gunns pulpmill will be putting into the atmosphere in the Tamar Valley are of a particularly harmful nature to the health of children.

Wouldn't it be a good idea to put a stop to this mill, before it causes all the predicted problems for roads, economy, water, environment, wildlife, and public health?
